

# Different Audiences

These are the people who who are doing the unexpected with your platform

- your platform might only be one of many possible components they might use
- what you think of as a full simulation might just be a step in their complicated automated process

# Campaign-Scale Software

- Difference with “workflow”
  - Campaign is a single scientific result from similar, coordinated, tasks. Details of pipeline may change.
  - Workflow is more general, typically involving different tasks in a relatively constant pipeline
- Examples:
  - Run many loosely-coupled MD runs (we'll see a few specific cases of this!)
  - Hyperparameter optimization
